

Gear GB LPG conversion kits

Easy to install

All our self-fit LPG kits have an installation video or an easy to follow step-by-step instruction manual with large colour imagery specific to the engine. These can be downloaded on our website from the attached PDF sheet manual for each kit, so you will have no problem converting your engine in just a few minutes. Alternatively, if you purchase a LPG conversion kit from us we will fit it to your machine free of charge.

Performance

We are often asked if LPG conversion reduces the maximum power output of an engine. With our LPG kits there is no loss of performance. Other manufacturers offer LPG conversion kits which are generic for multiple sizes of engines. This is to reduce their development and production costs. We know from experience that the engine will not run correctly both on petrol or LPG and may lose performance on either fuel type if the kit is not designed specific to that engine. This is because the LPG jet size and venturi size must be exact for that particular engine for air/ fuel mixture to prevent loss of performance

Quality assurance

All of our machined components are manufactured locally with the quick release connector and low pressure regulator manufactured in Germany and the USA respectively, ensuring our kits are the highest quality on the market. This gives us confidence in offering a 5 year component warranty for all of GearGB LPG conversion kits.
